

ABBOTT CLAIM

CONSERVATION INITIATIVES

Abbott Claim is part of a family-owned portfolio lauded for its long-term, multi-generational commitment to local communities, as well as environmental restoration, conservation, and regenerative farming.

Pollinator Health Program

The expansion of vineyards in the Pacific Northwest has the potential to negatively impact semi-natural areas rich in biodiversity that are key to pollinators and other organisms. We've partnered with OSU's Bee Friendly Farming program to help us foster practices that promote on-farm habitat that is vital for bees.

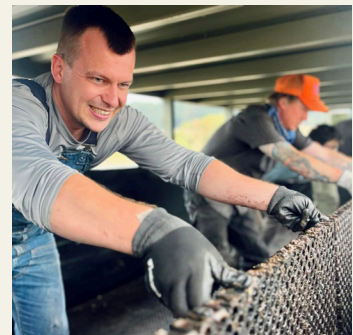

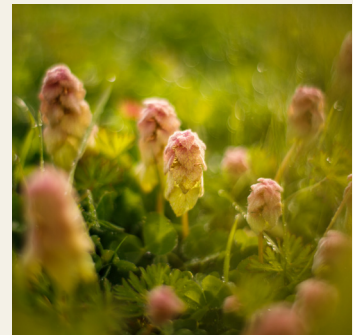

With 31 identified plant species on our property, 23 have been identified as bee friendly, six of which are 'super bee plants.' These varieties attract a wide diversity of bees, or rare specialist bees.

Research done at Abbott Claim by the OSU Pollinator Health Program identified 79 species of bees across four families inhabiting the property. We continue to partner with OSU on new plant inventory and bee monitoring tools.

BioFiltro

BioFiltro™ is a system that catalyzes the digestive power of worms and microbes to remove up to 99% of wastewater contaminants. We are proud to be the first winery in Oregon to install a BioFiltro system to clean all wastewater from the winery before it is sent to our pond, which in turn supports our organic farming program.

The system went into operation during the summer of 2020. The summer of 2023 was the first harvest of vermicompost produced as a byproduct of the BioFiltro system.
